UNSPECIFIED FUNGI, REPORTING REQUEST AND CONSENT

The RIDI™ system can potentially detect and identify all Fungi, Protozoa and Algae. The standard clinical report is set up to only report the top six hundred known pathogenic Fungi. Multiple studies in the last years show a broad variety of unspecified fungi being discovered in nature and in human disease that may only have a serial number or have yet to be exactly classified. Our recent publications and extensive clinical work have confirmed this. It is estimated that there are now over 1.5-5 million new unspecified/categorized fungi. These fungi are difficult to cultivate and are now being identified by modern DNA sequencing techniques. Many of these fungi are of 'Unknown Clinical Significance'. Through our experience, publications, and the growing literature we feel that these fungi may play a significant role in chronic disease and cancer.

If you or your institution want these unspecified detectable fungi reported; please sign and date the form here. Your clinical report will have an addendum reporting any unspecified fungi.
